FOD8316
2.5A Output Current, IGBT Drive Optocoupler with Desaturation Detection and Isolated Fault Sensing

Features
■ High Noise Immunity characterized by common mode rejection
  – 35kV/µs Minimum Common Mode Rejection (Vcm = 1500Vpk)
■ 2.5A peak output current driving capability for most 1200V/150A IGBT
■ Optically isolated fault sensing feedback
■ “Soft” IGBT turn-off
■ Built-in IGBT protection
  – Desaturation detection
  – Under voltage lockout protection
■ 1,414V (peak) working voltage rating
■ 8,000V (peak) transient isolation voltage rating
■ Wide supply voltage range from 15V to 30V
  – Use of P-Channel MOSFETs at output stage enables output voltage swing close to the supply rail (rail-to-rail output)
■ 3.3V/5V, CMOS/TTL compatible inputs
■ High Speed
  – 500ns max. propagation delay over full operating temperature range
■ Extended industrial temperature range, -40°C to 100°C temperature range
■ Safety and regulatory
  – UL1577, 4,243 V_RMS for 1 min.
  – DIN EN/IEC 60747-5-5
■ R_DS(ON) of 1Ω (typ.) offers lower power dissipation
■ User configurable: inverting, non-inverting, auto-reset, auto-shutdown
■ 8mm creepage and clearance distances

Applications
■ Industrial inverter
■ Induction heating
■ Isolated IGBT drive

Description
The FOD8316 is an advanced 2.5A Output Current IGBT Drive Optocoupler, capable of driving most 1200V/150A IGBTs. It is ideally suited for fast switching driving of power IGBTs and MOSFETs used in motor control inverter applications and high performance power systems. It offers critical protection features necessary for preventing fault conditions that lead to destructive thermal runaway of IGBTs.

It utilizes Fairchild’s patented coplanar packaging technology, Optoplanar®, and optimized IC design to achieve high noise immunity, characterized by high common mode rejection and power supply rejection specifications.

It consists of an integrated gate drive optocoupler featuring low R_DS(ON) CMOS transistors to drive the IGBT from rail to rail and an integrated high speed isolated feedback for fault sensing. The device is housed in a compact 16-pin small outline plastic package which meets the 8mm creepage and clearance requirements.

*Pin 8 ($V_{LED1-}$) is internally connected to Pin 4 (GND1).*
Safety and Insulation Ratings
As per DIN EN/IEC 60747-5-5. This optocoupler is suitable for “safe electrical insulation” only within the safety limit data. Compliance with the safety ratings shall be ensured by means of protective circuits.

# Absolute Maximum Ratings (\(T_A = 25^\circ\text{C}\) unless otherwise specified)

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

### Absolute Maximum Ratings

<td>ºC</td>
</tr>
<tr>
<td>(T_{SOL})</td>
<td>Lead Wave Solder Temperature (no solder immersion)</td>
<td>260 for 10 sec</td>
<td>ºC</td>
</tr>
</tbody>
</table>

Notes:
1. Maximum pulse width = 10µs, maximum duty cycle = 0.2%.
2. This negative output supply voltage is optional. It’s only needed when negative gate drive is implemented. Refer to “Dual Supply Operation – Negative Bias at Vss” on page 23.
3. No derating required across temperature range.
4. Derate linearly above 64ºC, free air temperature at a rate of 10.2mW/ºC
5. Functional operation under these conditions is not implied. Permanent damage may occur if the device is subjected to conditions outside these ratings.

### Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

### Recommended Operating Conditions

<table>
<thead>
<tr>
<th>Symbol</th>

<td>(V_{DD2})</td>
</tr>
</tbody>
</table>

Note:
6. During power up or down, it is important to ensure that VIN+ remains low until both the input and output supply voltages reaches the proper recommended operating voltages to avoid any momentary instability at the output state. See also the discussion in the “Time to Good Power” section on page 23.
**Isolation Characteristics**

Apply over all recommended conditions, typical value is measured at $T_A = 25^\circ C$.

<td></td>
</tr>
</tbody>
</table>

**Notes:**
7. Device is considered a two terminal device: Pins 1 to 8 are shorted together and Pins 9 to 16 are shorted together.
8. 4,243 VRMS for 1 minute duration is equivalent to 5,091 VRMS for 1 second duration.
9. The Input-Output Isolation Voltage is a dielectric voltage rating as per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating refer to your equipment level safety specification or DIN EN/IEC 60747-5-5 Safety and Insulation Ratings Table.

**Electrical Characteristics**

Apply over all recommended conditions, typical value is measured at $V_{DD1} = 5V$, $V_{DD2} - V_{SS} = 30V$, $V_E - V_{SS} = 0V$, $T_A = 25^\circ C$ unless otherwise specified.

</tr>
</tbody>
</table>

**Notes:**
10. Maximum pulse width = 10µs, maximum duty cycle = 0.2%.
11. Maximum pulse width = 4.99ms, maximum duty cycle = 99.8%.
12. $V_{OH}$ is measured with the DC load current in this testing (Maximum pulse width = 1ms, Maximum duty cycle = 20%). When driving capacitive loads, $V_{OH}$ will approach $V_{DD}$ as $I_{OH}$ approaches zero units.
13. Positive Output supply voltage ($V_{DD2} - V_E$) should be at least 15V. This is to ensure adequate margin in excess of the maximum Under Voltage Lockout Threshold $V_{UVLO}^+$ of 13.5V.
14. When $V_{DD2} - V_E > V_{UVLO}$ and output state $V_O$ of the FOD8316 is allowed to go high, the DESAT detection feature will be active and will provide the primary source of IGBT protection. UVLO is needed to ensure DESAT detection is functional.
15. The blanking time, $t_{BLANK}$ is adjustable by an external capacitor (C$_{BLANK}$) where $t_{BLANK} = C_{BLANK} * (V_{DESAT}/I_{CHG})$

### Switching Characteristics
Apply over all recommended conditions, typical value is measured at $V_{DD1} = 5V$, $V_{DD2} - V_{SS} = 30V$, $V_E - V_{SS} = 0V$, $T_A = 25^\circ C$ unless otherwise specified.

Notes:
16. This load condition approximates the gate load of a 1200 V/150A IGBT.
17. $t_{PHL}$ propagation delay is measured from the 50% level on the falling edge of the input pulse ($V_{IN+, V_{IN-}}$) to the 50% level of the falling edge of the $V_O$ signal. Refer to Figure 48.
18. $t_{PHL}$ propagation delay is measured from the 50% level on the rising edge of the input pulse ($V_{IN+, V_{IN-}}$) to the 50% level of the rising edge of the $V_O$ signal. Refer to Figure 48.
19. PWD is defined as $|t_{PHL} - t_{PLH}|$ for any given device.
20. The difference between $t_{PHL}$ and $t_{PLH}$ between any two FOD8316 parts under same operating conditions, with equal loads.
21. This is the amount of time the DESAT threshold must be exceeded before $V_O$ begins to go low. This is supply voltage dependent. See Figure 49.
22. This is the amount of time from when the DESAT threshold is exceeded, until the FAULT output goes low. See Figure 49.
23. This is the amount of time the DESAT threshold must be exceeded before $V_O$ begins to go low, and the FAULT output to go low. See Figure 49.
24. This is the amount of time from when RESET is asserted low, until FAULT output goes high. See Figure 49.
25. $t_{UVLO\_ON}$ UVLO Turn On Delay is measured from $V_{UVLO+}$ threshold voltage of the output supply voltage ($V_{DD2}$) to the 5V level of the rising edge of the $V_O$ signal.
26. $t_{UVLO\_OFF}$ UVLO Turn Off Delay is measured from $V_{UVLO-}$ threshold voltage of the output supply voltage ($V_{DD2}$) to the 5V level of the falling edge of the $V_O$ signal.
27. $t_{GP}$ Time to Good Power is measured from 13.5V level of the rising edge of the output supply voltage ($V_{DD2}$) to the 5V level of the rising edge of the $V_O$ signal.
28. Common mode transient immunity at output high state is the maximum tolerable negative $dV_{CM}/dt$ on the trailing edge of the common mode pulse, $V_{CM}$, to assure that the output will remain in the high state (i.e., $V_O > 15$ V or FAULT > 2 V).
29. Common mode transient immunity at output low state is the maximum positive tolerable $dV_{CM}/dt$ on the leading edge of the common mode pulse, $V_{CM}$, to assure that the output will remain in a low state (i.e., $V_O < 1.0$ V or FAULT < 0.8 V).

Application Information

Functional Description

The typical application circuit is shown in Figure 50 and the functional behavior of the FOD8316 is illustrated by the detailed internal schematic shown in Figure 51. This helps explain the interaction and sequence of internal and external signals, together with the timing diagrams.

1. Non-Inverting and Inverting Inputs

There are two CMOS/TTL compatible inputs, \(V_{IN+}\) and \(V_{IN-}\), to control the IGBT, in non-inverting and inverting configurations respectively. When \(V_{IN-}\) is set to low, \(V_{IN+}\) controls the driver output, \(V_O\), in non-inverting configuration. When \(V_{IN+}\) is set to high, \(V_{IN-}\) controls the driver output in inverting configuration.

The relationship between the inputs and output are illustrated in the Figure 52.

During normal operation, when no fault is detected, the \(FAULT\) output, which is an open-drain configuration, will be latched to high state. This allows the gate driver to be controlled by the input logic signal.

When a fault is detected, the \(FAULT\) output will be latched to low state. This condition will remain until the \(RESET\) pin is also pulled low for a period longer than \(PW_{RESET}\). While setting the \(RESET\) pin to a low state, the input pins must be pulled to low to ensure an output state (\(V_{IN+}\) is low or \(V_{IN-}\) is high).

Figure 50. Recommended Application Circuit

Figure 51. Detailed Internal Schematic
2. Gate Driver Output

A pair of PMOS and NMOS transistors make up the output driver stage, which facilitates close to rail-to-rail output swing. This feature allows a tight control of gate voltage during on-state and short circuit condition. The output driver is typically capable of sinking 2A and sourcing 2A at room temperature. Due to the low RDS(ON) of the MOSFETs, the power dissipation is reduced as compared to those bipolar-type driver output stages. The absolute maximum rating of the output peak current, IOP(PEAK), is 3A, thus the careful selection of the gate resistor, Rg, is required to limit the short circuit current of the IGBT.

As shown in Figure 51, the gate driver output is influenced by signals from the photodetector, the UVLO comparator, and the DESAT signals. Under no fault condition, normal operation resumes while the supply voltage is above the UVLO threshold, the output of the photodetector will drive the MOSFETs of the output stage.

The logic circuitry of the output stage will ensure that the push-pull devices will never be turned “ON” simultaneously. When the output of the photodetector is high, the output, VO, will be pulled to high state by turning on the PMOS. When the output of the photodetector is low, VO will be pulled to low state by turning on the NMOS.

When VDD2 supply goes below VULVO, which is the designated ULVO threshold at the comparator, VO will be pulled down to low state regardless of photodetector output.

When desaturation is detected, VO will turn off slowly as it is pulled low by the NMOS device, the input to the Fault Sense circuitry is high. The output voltage, VO, remains low irrespective of the inputs as long as the supply voltage, VDD2 – VE, is less than VULVO+. When the supply voltage falls below VULVO-, VO will go low, as illustrated in Figure 54.

4. “Soft” Turn-Off

The soft turn-off feature ensures the safe turn off of the IGBT under fault condition. This reduces the voltage spike on the collector of the IGBT. Without this, the IGBT would see a heavy spike on the collector and hence resulting in a permanent damage to the device when it’s turned off immediately.

5. Under Voltage Lockout

Under voltage detection prevents the application of insufficient gate voltage to the IGBT. This could be dangerous, as it would drive the IGBT out of saturation and into the linear operation where the losses are very high and quickly overheated. This feature ensures the proper operating of the IGBTs. The output voltage, VO, remains low regardless of the inputs as long as the supply voltage, VDD2 – VE, is less than VULVO+. When the supply voltage falls below VULVO-, VO will go low, as illustrated in Figure 54.

6. Time to Good Power

At initial power up, the LED is off and the output of the gate driver should be in the low or off state. Sometimes race conditions exist that causes the output to follow the VO (assuming VDD2 and VE are connected externally), until all of the circuits in the output IC have stabilized. This condition can result in output transitions or transients that are coupled to the driven IGBT. These transients can cause the high and low side IGBTs to conduct shoot-through current that may result in destructive damage to the power semiconductor devices. Fairchild has introduced an initial turn-on delay which is generally regarded as “time to good power”. This delay, typically 30µs, is only present during the initial power-up of the device. Once powered, the “time to good power” delay is determined by the delay of the UVLO circuitry. If the LED is “ON” during the initial turn-on activation, low to high transition at the output of the gate driver will only occur 30µs after the VDD power is applied.

7. Dual Supply Operation – Negative Bias at VSS

The IGBT’s off-state noise immunity can be enhanced by providing a negative gate to emitter bias when the IGBT is in the off-state. This static off-state bias can be supplied by connecting a separate negative voltage source between the VE (pin 16) and VSS (pin 9 & 10). Figure 51 illustrates the two distinct grounds. The primary ground reference is the IGBT’s emitter connection - VE, pin 16. The under-voltage threshold and desaturation voltage detection are referenced to the IGBT’s emitter (VE) ground.

The recommended application circuit, Figure 50, shows the interconnection of the VDD2 and VE supplies. The IGBT’s gate to emitter voltage is the absolute value sum of the VDD2 supply and the VSS reverse bias. The negative voltage supply at VSS appears at the gate drive input, VO, when the FOD8316 is in the low state. When
the input drives the output high, the output voltage, $V_O$, will have the potential of the $V_{DD2}$ and $V_{SS}$.

Figure 50 shows the operation with a dual or split power supply. The $V_{ss}$ supply provides the negative gate bias, and $V_{DD2} + V_{SS}$ supplies power to the output IC. The $V_{SS}$ and $V_{DD2}$ supplies require three power supply bypass capacitors. These capacitors provide the low equivalent series resistant (ESR) paths for the instantaneous gate charging and discharging currents.

Selecting capacitors with low ESR will optimize the available output current. C3 is a low ESR 1812 style, 10µF, multilayer ceramic capacitor. This capacitor is the primary filter for the Vss and $V_{DD2}$ supplies. C1 and C2 are also low ESR capacitors. They provide the primary gate charge and discharge paths. The Schottky diode, D1, is connected between $V_E$ and $V_{SS}$ to protect against a reverse voltage greater than 0.5V.

DISCLAIMER
FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HERETOFROM TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY
FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:
1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY
Fairchild Semiconductor Corporation’s Anti-Counterfeiting Policy. Fairchild’s Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild’s quality standards for handling and storage and provide access to Fairchild’s full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise.

Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
